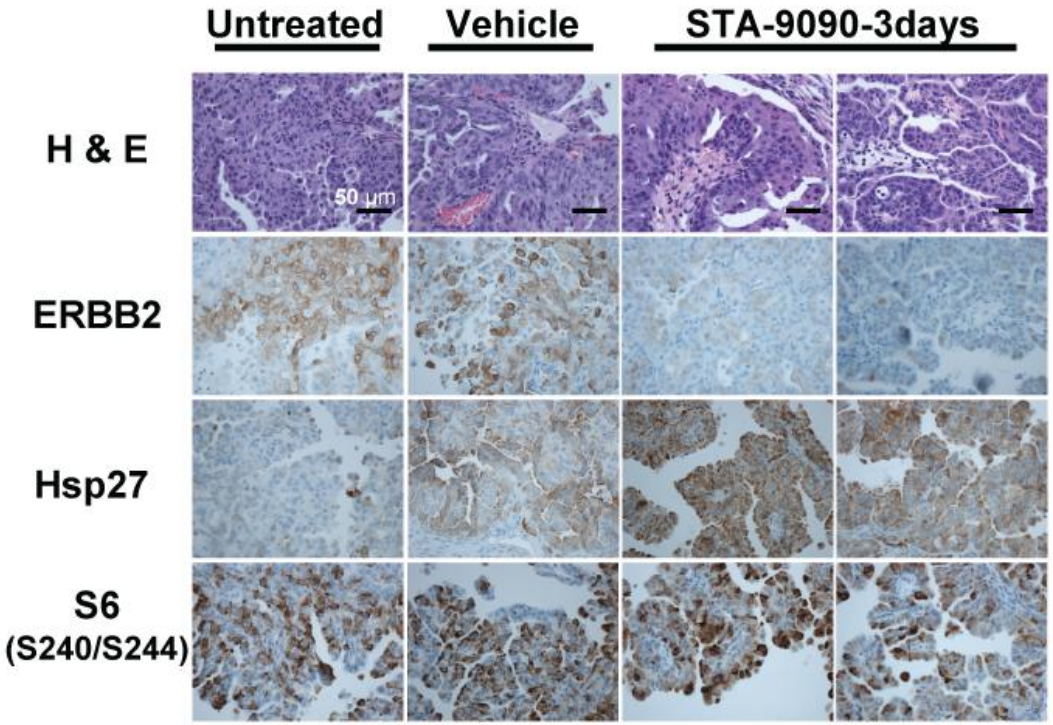
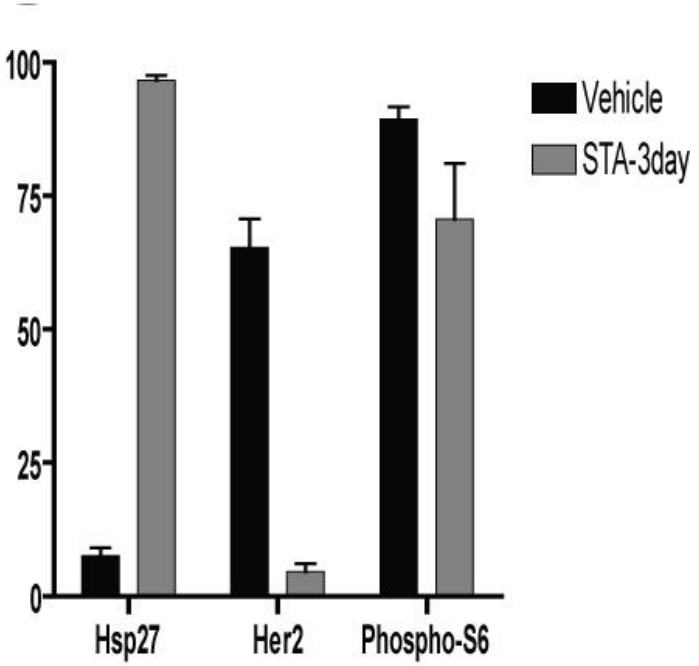
Pharmacodynamics of STA-9090 in mutant ErbB2-driven murine adenocarcinoma



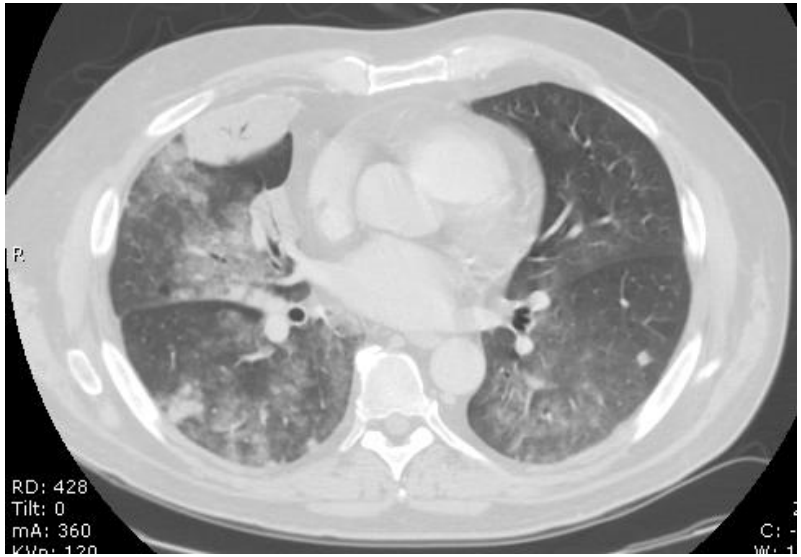


Phase 1 Ganetespib Safety Summary

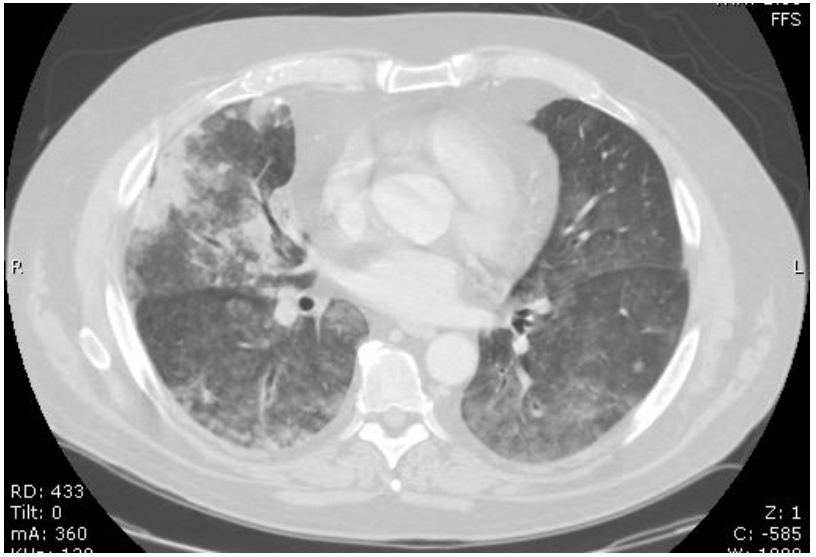
- Once-weekly dosing (3/4) MTD is 216 mg/m^2; recommended Phase 2 single agent dose is 200 mg/m^2
- Twice-weekly schedule (3/4) now evaluating 173 mg/m^2
- DLT is mild to moderate, manageable diarrhea (typical duration 24h post dose)
- Severe liver toxicity not observed
  - AST\ALT NCI CTC Gr ≥3 in 2-3% of patients (N=198)
  - Reversible and manageable with dose delay and reduction
- Only minimal ocular toxicity observed
  - 1 patient (0.5%; N=198) had symptoms consistent with ocular toxicity
  - Several patients (2-3%; N=198) had symptoms that may suggest ocular toxicity
- Bone marrow toxicity not observed

66M, NSCLC

Prior treatments included carboplatin, paclitaxel, bevacizumab, erlotinib, pemetrexed, topotecan, bortezomib, experimental retinoid; longest treatment duration: 2-4 months



Baseline



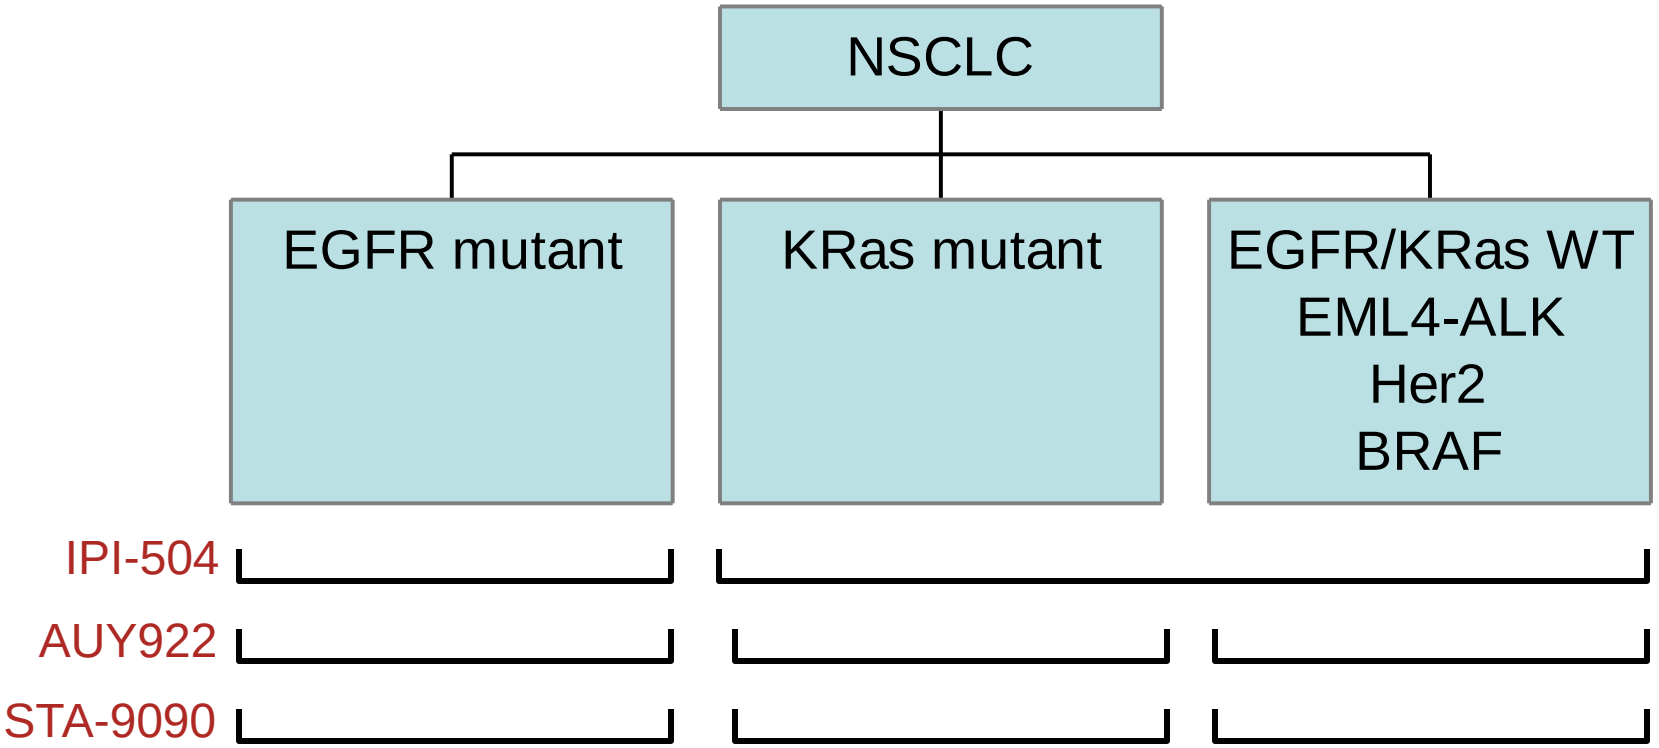
Post 4 cycles

Ganetespib 150 mg/m^2: 26% total TL tumor shrinkage. Duration: 13 months

Additional Durable Responses and Regressions in Phase 1 Studies

- Melanoma (PR)
- Colon (PR)
- RCC (durable regression)
- GIST (durable regression)
- NSCLC (durable regression)
- AML (hematologic improvement)
- CML (hematologic improvement)

Schema for Hsp90 Inhibitor Trials in NSCLC



Phase 2 Study of Ganetespib in NSCLC

Ganetespib at 200 mg/m2 qW for 3 wks, 1 wk off until disease progression

Stage IIIB/IV NSCLC PS 0 and 1 PD at study entry

- **A: mutant EGFR (n=15)**
- **B: mutant K-Ras (n=17)**
- **C: wild type EGFR / wild type K-Ras (n=25)**
- **D: Extension: adenocarcinoma only (n=32)**

- Genotyping required for all patients
- Primary endpoint : PFS at 16 wks
- Two stage design: for cohorts A,B,C: Stage 1 (n=14 pts); if ≥ 2 pts progression-free at week 16, enroll Stage 2 (n = 9 pts)
- Patients who progressed on single agent but had some clinical benefit were allowed to roll over to cohort E: weekly ganetespib + docetaxel (n=5)

Analysis Population: Cohort C & D

Evaluable patients for clinical activity (N = 33)

- Adenocarcinoma patients with wild-type EGFR & K-ras
- Met main inclusion / exclusion criteria
- Received at least one dose of study drug
- Had both baseline and at least one follow-up radiological assessment

Safety population (N = 36)

- All adenocarcinoma patients with wild-type EGFR & K-ras who received at least one dose of study drug

Demographics and Baseline Status

	N=36

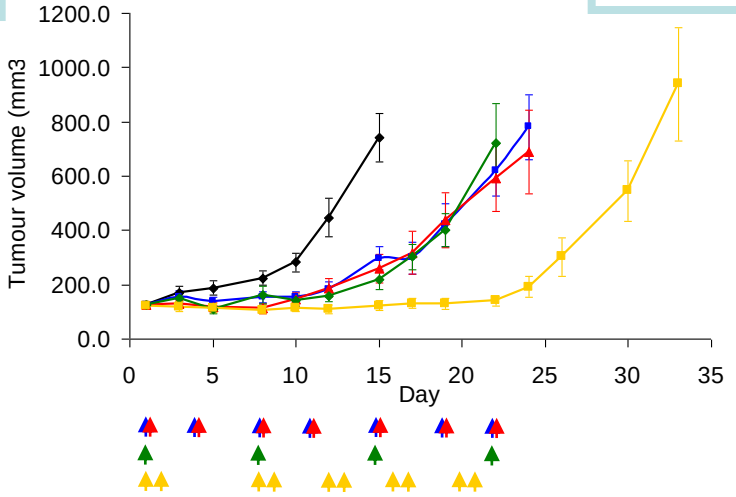
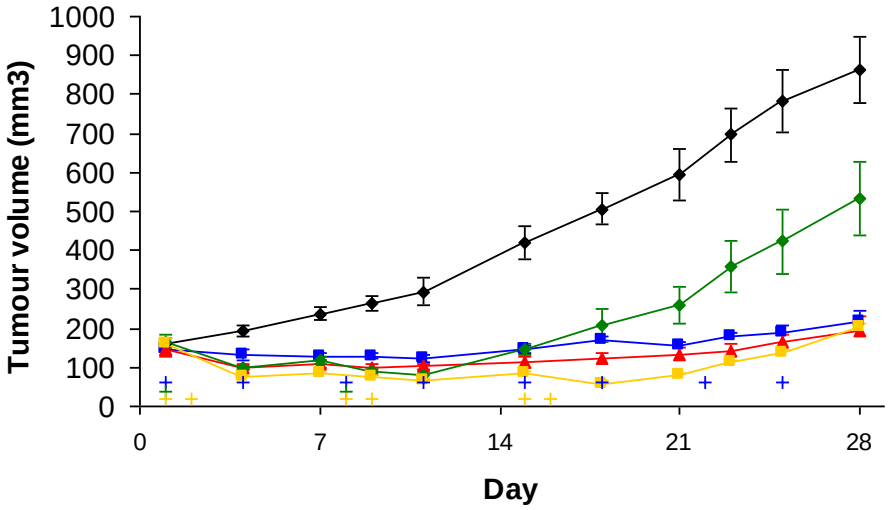
A375

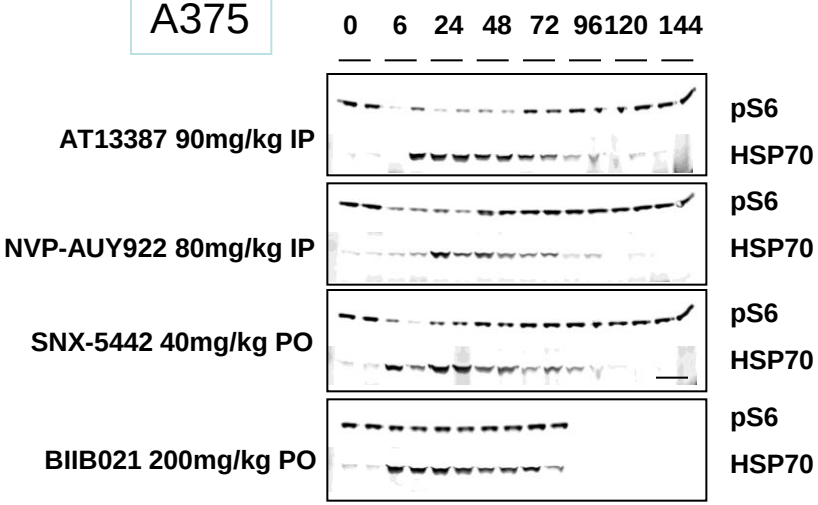


MV4-11



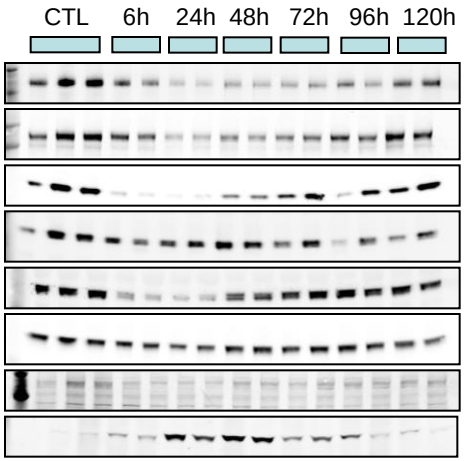
Pharmacodynamic Effects of AT13387 in Xenografts

A375

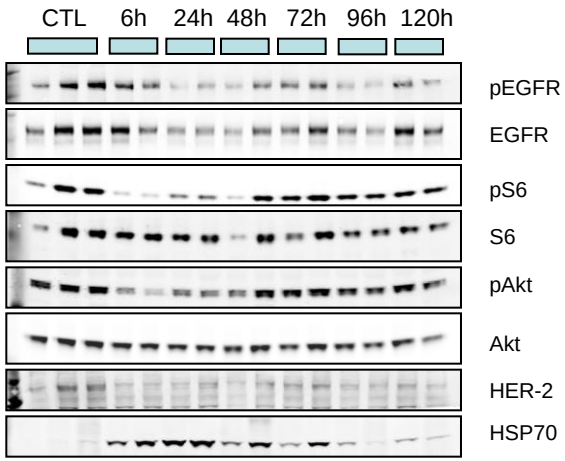


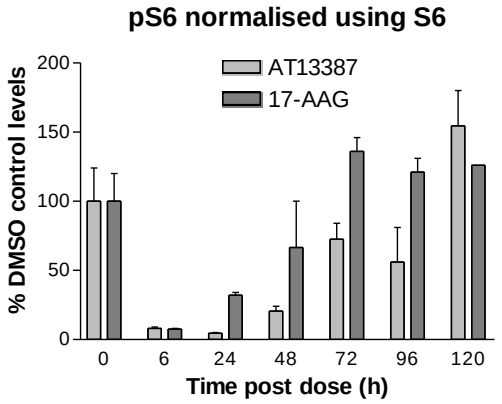
Extended tumor pharmacodynamics are a consequence of 2 properties:
Slowly reversible HSP90 inhibition
Long tumor half life

AT13387 80mg/kg IP



17-AAG 80mg/kg IP





NCI-H1975

AT13387 - Phase I Study

Dose escalation study in patients with refractory solid malignancies

- Enrichment for tumor types whose growth is dependent upon known HSP90 client proteins
  - melanoma, lung, prostate or breast
- Schedules
  - Twice weekly schedule: 1 hour IVI, three weeks out of four (days 1,4,8,11,15,18 q. 28)
  - Once weekly schedule: 1 hour IVI, three weeks out of four (days 1, 8, & 15 q. 28)

AT13387 Twice Weekly Schedule

Dose Level *(total dose per 4 week cycle)*	**Patients Treated (Number)**	**Number of Cycles Received**	**Dose Limiting Toxicities**
10 mg/m^2 *(60 mg/m^2)*	Glioblastoma multiforme (1) Prostate cancer (1) Colorectal adenocarcinoma (2)	1- 3 *(median 2)*	None
20 mg/m^2 *(120 mg/m^2)*	Thyroid cancer (1) Melanoma (1) Colorectal adenocarcinoma (1)	2– 6 *(median 2)*	None
40 mg/m^2 *(240 mg/m$^{2)}$*	Melanoma (2) Squamous cell carcinoma of the oesophagus (1)	2 - 3 *(median 3)*	None
80 mg/m^2 *(Six doses = 480 mg/m$^{2)}$*	Colorectal adenocarcinoma (2) Melanoma (1) Carcinoma of the pituitary gland (1) NSCLC (1)	1 – 8 *(median 2)*	None
120 mg/m^2 *(Six doses = 720 mg/m^2)*	Synovial sarcoma (1) Melanoma (3), NSCLC (3) Pancreatic cancer (1) Colon cancer (1), GIST (1) Small cell bladder cancer (1) Prostate cancer (1), Breast cancer (1)	1 – 4 (*median 2*)	Diarrhea & fatigue (Grade 1 and 2) Reversible visual changes (Grade 1 - 3) Hypotension during dosing (Grade 2) Dry skin/mouth (Grade 1)

120 mg/m^2/day declared as MTD on basis of aggregated toxicities

AT13387 Twice-Weekly Schedule

- 28 patients treated with twice-weekly dosing, 10 mg/m^2 to 120 mg/m^2
- MTD/RP2D: 120 mg/m^2 on the basis of aggregate mild/moderate toxicities (plus 1 DLT – grade 3 visual disturbance)
- Gastrointestinal toxicity (especially transient diarrhoea) and fatigue most commonly reported
- 9/9 patients treated with 120 mg/m^2 twice weekly experienced visual disturbances (13 pts actually treated at this dose)
- 3 AEs of QTc prolongation reported: Grade 1 in two pts (one at 10 mg/m^2 and one at 80 mg/m^2); Grade 2 in one pt at 120 mg/m^2 Review of QT data from Holter monitoring showed no consistent effects; QT prolongation post-dosing only seen in patients with abnormal QT at baseline
- Two patients had SD > 6 months: uveal melanoma; follicular thyroid ca

AT13387 Once Weekly Schedule

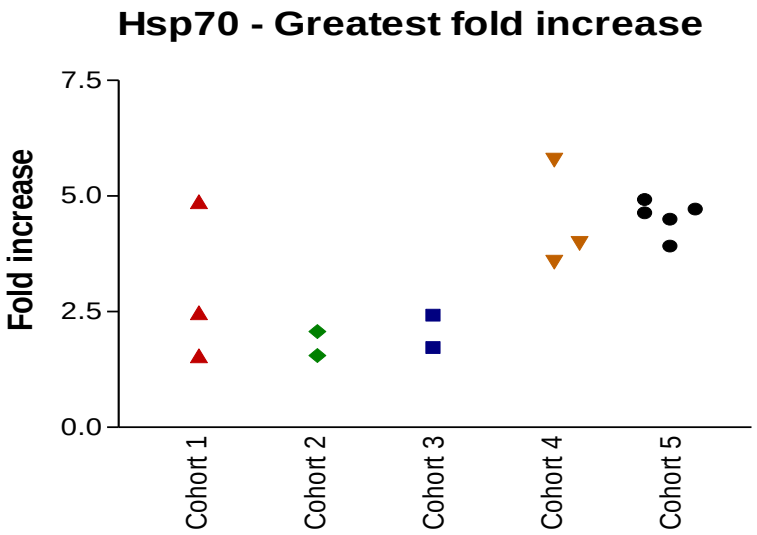
Dose Level *(total dose per 4-week cycle)*	**Patients Treated (Number)**	**Number of Cycles Received**	**Dose Limiting Toxicities/AE's**
150 mg/m^2 *(450 mg/m^2)*	Mesothelioma (1) Pancreatic (1) GIST (1) Melanoma (1)	1- 3 *(all patients off study, median 1 cycle)*	No DLTs; 1/4 visual disturbances (with dry eyes); 2/4 infusion reactions
180 mg/m^2 *(540 mg/m^2)*	GIST (1) Rectal (1) Bronchioloalveolar (1)	2-3 *(all patients off study, median 3 cycles)*	No DLTs; 3/3 with grade 1-2 GI toxicities; 1/3 infusion site reaction 1/3 color vision disturbance
220 mg/m^2 *(660 mg/m^2)*	GIST (1) Colon (1) Melanoma (1) NSCLC (2) Cholangiocarcinoma (1)	Cycle 3 complete (PET response/SD), ongoing Died 1 week after 1st dose (PD?) Cycle 1 complete, ongoing PD after 1 cycle Cycle 1 day 8 – 25th Jan, ongoing Cycle 1 day 15 – 24th Jan, ongoing	No DLTs; All patients had grade 1-2 GI symptoms (nausea, diarrhea). Insomnia, HA, scalp soreness, palatal swelling & pain, fatigue, chills, flushing, & infusion site reactions also seen; Grade 1 visual disturbance in 2 pts (apparent movement of stationary objects; color disturbance)

HSP70 is Up-Regulated in PBMCs in a Dose-Dependent Manner

Cohort 5 (120mg/m2/day) Pt 01 006

Hsp70 is induced in peripheral blood mononuclear cell (PBMC) lysates during infusion

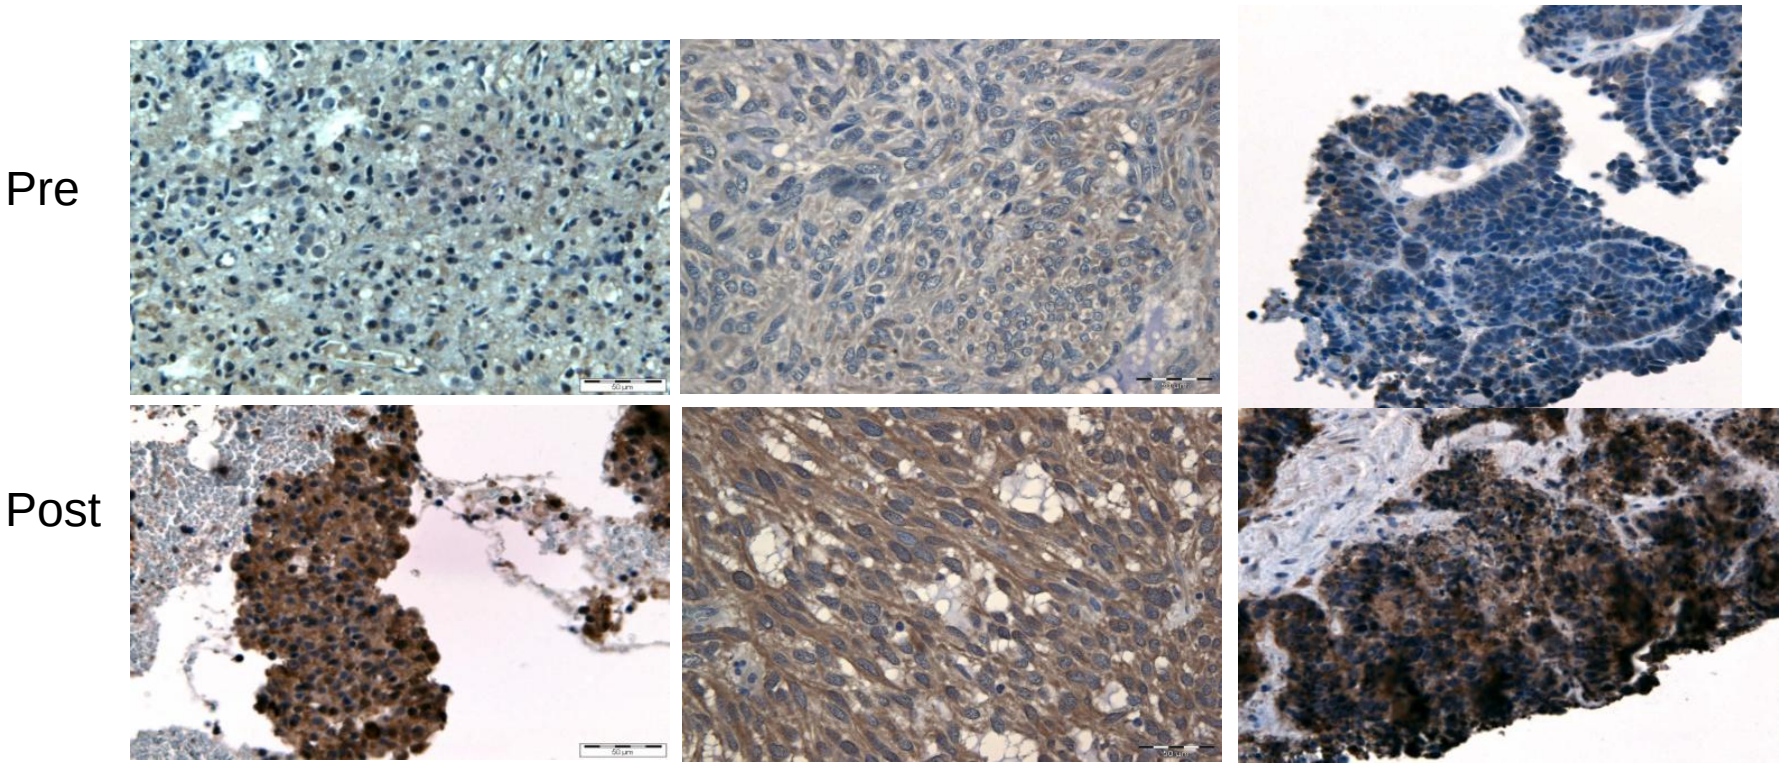
Across cycles in each patient



The greatest fold increase in Hsp70 is plotted for each individual

Trend is for larger fold consistent increases at 80 mg/m^2 and above

Hsp70 Induction in Tumor Biopsies

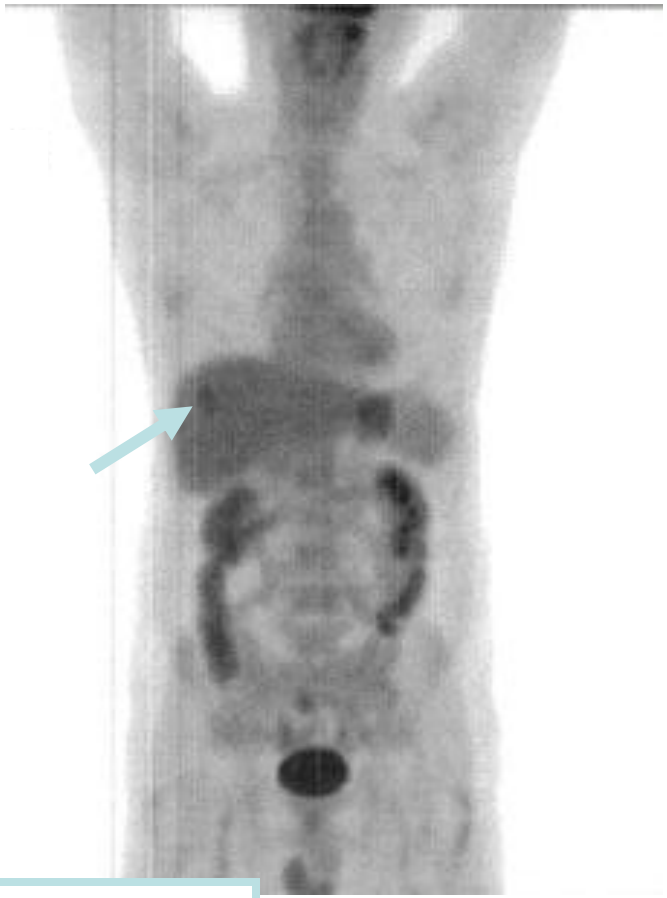


Post-treatment biopsies taken on day 19; 24 hours after 6th dose at 120 mg/m^2

GIST FDG-PET Response

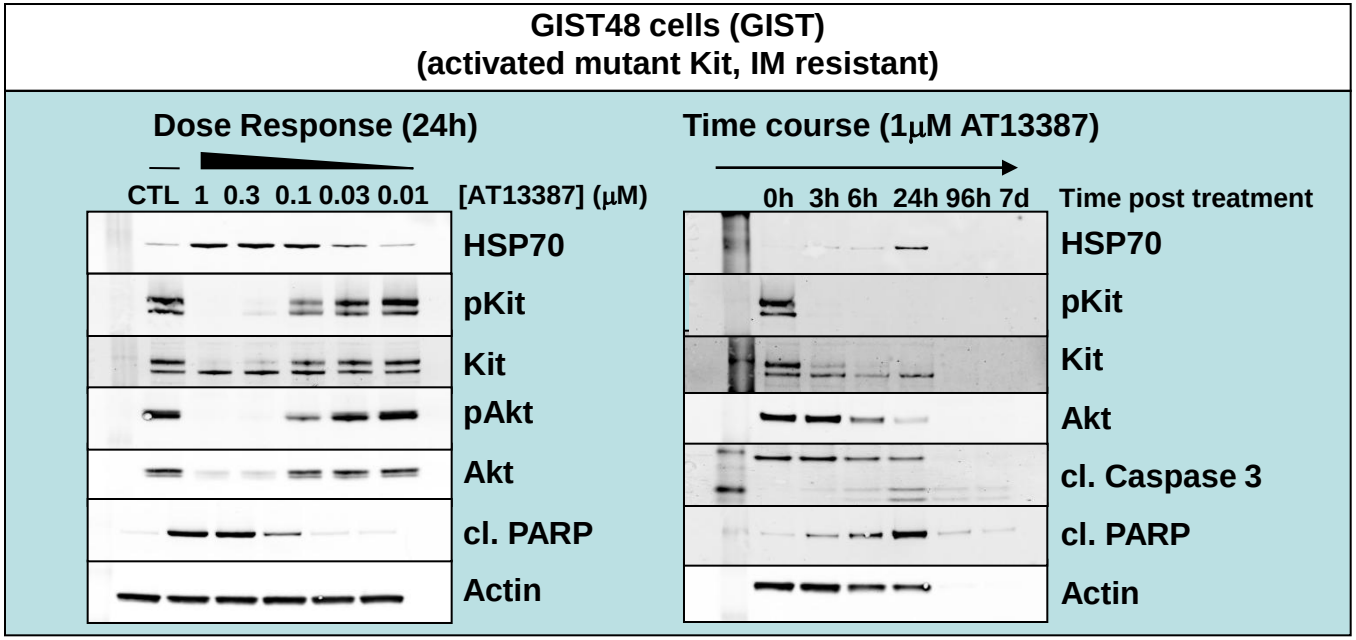
Pre-treatment
(2nd Nov 2010)

Post-treatment
(23rd Nov 2010)



220 mg/m^2 weekly

Preclinical Data to Support Phase 2 Trial in GIST



Sensitivity of GIST cell lines to AT13387

Cell Line (Derivation)	Mutation	Resistance Pharmacology	Antiproliferative IC_{50} (nM)			
			AT13387	17 AAG	Imatinib	Sunitinib
GIST-T1 (Treatment naïve)	KIT Exon 11	Imatinib sensitive	36	29	45	25
GIST-882 (Treatment naïve)	KIT Exon 13	Imatinib sensitive	72	130	180	69
GIST-430 (PD on imatinib)	KIT Exon 11 +V654A	Imatinib resistant	100	285	>1000	285
GIST-48B	KIT independent	Imatinib and sunitinib resistant	310	890	>1000	>1000

AT13387 – Clinical Development Plan

Single agent trials

- Phase I (HER2 enriched) AT13387 twice weekly consecutive day schedule: 2 patients treated
- TKI-refractory NSCLC (weekly schedule planned)
- JAK-positive myeloproliferative disease

Combination trials

- With trastuzumab in HER2 amplified breast cancer
- With bortezomib in multiple myeloma
- With Ara-C in FLT3-driven AML
- With Cdk inhibitor
- With PARP inhibitor
- With MEK inhibitor in ocular melanoma

Conclusions

- Second generation Hsp90 inhibitors have greater *in vitro* potency than 17-AAG and improved *in vivo* efficacy in xenograft models.
- Preclinical PK demonstrate prolonged persistence in the tumor compartment, variable kinetics of client depletion. For some clients, including EGFR, more frequent dosing that once-weekly may be necessary.
- STA-9090 has activity in murine models of lung adenocarcinoma.
- STA-9090 and AT13387 are reasonably well tolerated in once-weekly and twice-weekly schedules.
- GI toxicity (diarrhea) is commone, generally grade 1 -2 and manageable with supportive care. Absence of severe hepatotoxicity. STA-9090 also notable for only minimal ocular toxicity.
- For STA-9090, single agent activity has been observed, especially in NSCLC with wild-type EGFR and wild-type KRas (genotypic analysis ongoing).
- Preclinical synergism with taxanes supports a plan for a Phase 2b/3 NSCLC trial of STA-9090 in combination with docetaxel.
- Preclinical data in GISTmodels support re-examination of this disease type with non-hepatotoxic Hsp90 inhibitors.
- Novel approaches are needed, including strategies that may deplete other chaperone proteins.
